Terraform

Key Takeaways

Terraform Modules

It enables you to define, package, and deploy standardized components across projects, promoting both code maintainability and environmental flexibility.

What is Module?

Modules are the main way to package and reuse resource configurations with Terraform. It contains collection of .tf and/or .tf.json files in a directory.

Module Structure

Input variables

To receive values from the calling module.

Output variables

To give results back to the calling module so it can use them to fill in arguments elsewhere.

Resources

To specify and handle one or more infrastructure objects within the module.

Module Structure (Example)

```
$ tree complete-module/
```

```
.
```

```
├─ README.md
```

```
├─ main.tf
```

```
├─ variables.tf
```

```
├─ outputs.tf
```

```
├─ LICENSE
```

```
├─ ...
```

```
├─ modules/
```

```
|   └─ nestedA/
```

```
|   |   └─ README.md
```

```
|   |   └─ variables.tf
```

```
|   |   └─ main.tf
```

```
|   |   └─ outputs.tf
```

```
|   └─ .../
```

CODE EDITOR

Root Modules

Only required element. This should be the main entry point for the module and contain specific configurations.

```
$ tree complete-module/  
.  
├─ README.md  
├─ main.tf  
├─ variables.tf  
├─ outputs.tf  
├─ LICENSE  
├─ ...  
├─ modules/  
│   └─ nestedA/  
│       ├── README.md  
│       ├── variables.tf  
│       ├── main.tf  
│       └─ outputs.tf  
└─ .../
```

README

It contains description of the module and what it should be used for.

CODE EDITOR

```
$ tree complete-module/
```

```
.
```

```
├── README.md
```

```
├── main.tf
```

```
├── variables.tf
```

```
├── outputs.tf
```

```
├── LICENSE
```

```
├── ...
```

```
├── modules/
```

```
|   ├── nestedA/
```

```
|   |   ├── README.md
```

```
|   |   ├── variables.tf
```

```
|   |   ├── main.tf
```

```
|   |   ├── outputs.tf
```

```
|   └── .../
```

LICENSE

It contains the terms and conditions for using, modifying, and distributing the code (e.g Modules) in the repository.

```
$ tree complete-module/
.
├── README.md
├── main.tf
├── variables.tf
├── outputs.tf
├── LICENSE
├── ...
├── modules/
│   ├── nestedA/
│   │   ├── README.md
│   │   ├── variables.tf
│   │   ├── main.tf
│   │   └── outputs.tf
│   └── .../
```

main.tf, variables.tf, outputs.tf

The recommended filenames for a **minimal** module, even if they're empty. **main.tf** should be the primary entrypoint.

```
CODE EDITOR

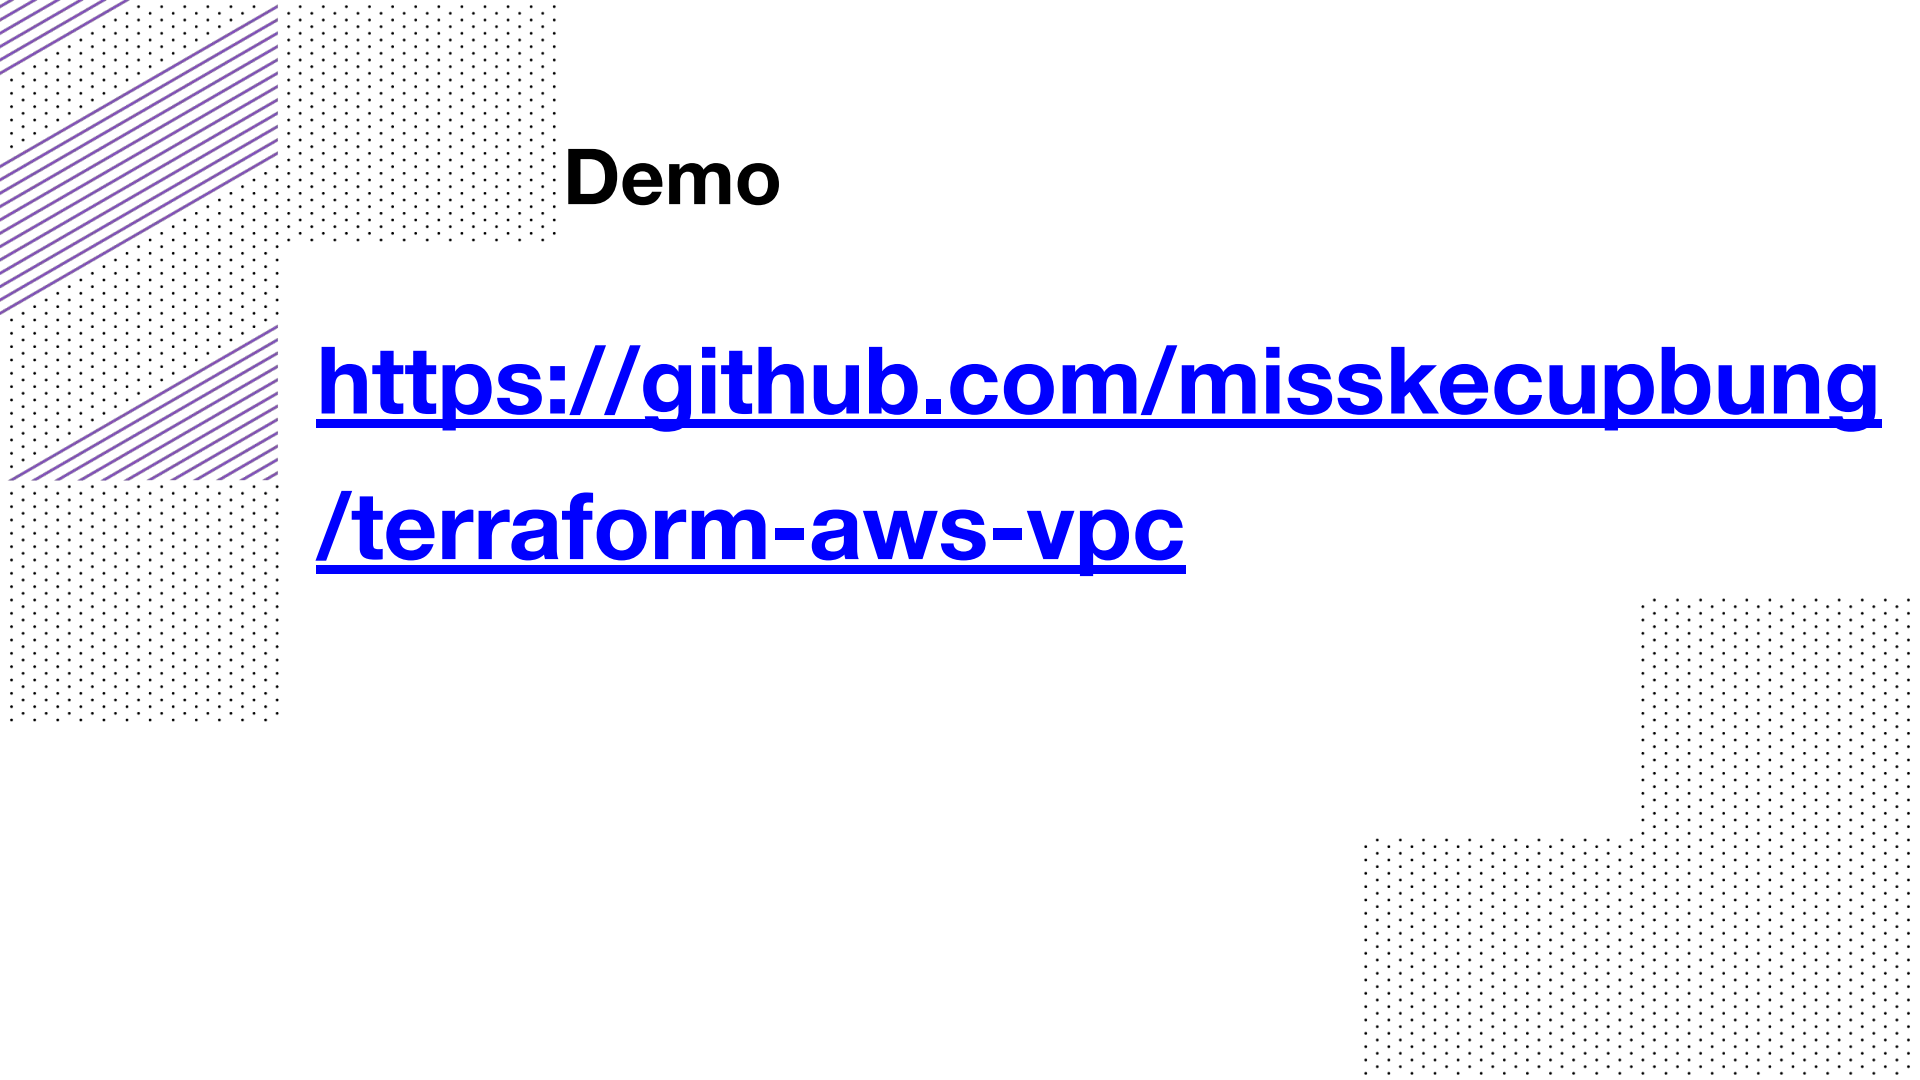

$ tree complete-module/
.
├── README.md
├── main.tf
├── variables.tf
├── outputs.tf
├── LICENSE
├── ...
├── modules/
│   ├── nestedA/
│   │   ├── README.md
│   │   ├── variables.tf
│   │   ├── main.tf
│   │   ├── outputs.tf
│   └── .../
```

```
variable "image_id" {  
    type      = string  
    description = "The id of the machine image (AMI) to use for the  
server."  
}  
  
output "db_password" {  
    value      = aws_db_instance.db.password  
    description = "The password for logging in to the database."  
    sensitive  = true  
}
```

variables.tf, outputs.tf

All variables and outputs should have a short description explaining what it's for. This helps people know what each part of the code does.
