What a headache?

- ❑ Memorising docker commands is hard.
- ❑ Memorising aliases is slightly less hard.
- ❑ Keeping track of your containers across multiple terminal windows is near impossible.

Halaman LazyDocker

Features (1)

Everything is one keypress away (or one click away! Mouse support FTW):

- viewing the state of your docker or docker-compose container environment at a glance
- viewing logs for a container/service
- viewing ascii graphs of your containers' metrics so that you can not only feel but also look like a developer

Features (2)

Everything is one keypress away (or one click away! Mouse support FTW):

- customising those graphs to measure nearly any metric you want
- attaching to a container/service
- restarting/removing/rebuilding containers/services
- viewing the ancestor layers of a given image
- pruning containers, images, or volumes that are hogging up disk space

```
